

QUAD BIKE SAFETY

WHAT
YOU NEED TO
KNOW

A quad bike can be a useful piece of equipment but, as with any farm equipment, it can have serious safety risks when used incorrectly. This poster highlights things you need to consider before purchasing a quad bike for on-farm use.

CAUTION

BEFORE YOU BUY

Find out whether a quad bike is the best vehicle option for your farm.

- Identify your needs and relevant operator safety issues – eg riders must not carry passengers (unless specifically designed) and must be aged 16 or over.
- Compare vehicle options to your needs.
- Talk to your dealer and others with relevant knowledge.

TRAINING

Due to the specific design features and handling characteristics of a quad bike, all riders should undertake an accredited training course.

- You must ensure that anyone using a quad bike on your farm has appropriate information, training and supervision. This includes employers, workers and others – eg visitors.
- Ask your dealer about trainers in your local area.
- Supervise inexperienced operators.

HELMETS AND OTHER PPE

Quad bikes are no different to any other motorcycle when it comes to personal protective equipment (PPE). Always wear a helmet when operating a quad bike.

It is important to meet your legal requirements when it comes to wearing PPE in the workplace – ensure you comply with the advice provided in the owner's manual.

Typical PPE other than helmets include:

- eye protection
- hand protection
- long-sleeve shirt and full-length pants
- sturdy footwear.

ATTACHMENTS

Before purchasing attachments, ensure they are suitable for use with your quad bike. Attachments on your quad bike can reduce the stability, operator control and performance of the vehicle.

This poster was developed by the Trans-Tasman quad bike industry solutions program working party, under the auspices of Heads of Workplace Safety Authorities.
