

The GHS in brief

Globally Harmonised System

What is the GHS?

The Globally Harmonised System of Classification and Labelling of Chemicals (GHS) is an internationally agreed system for classifying and labelling hazardous chemicals

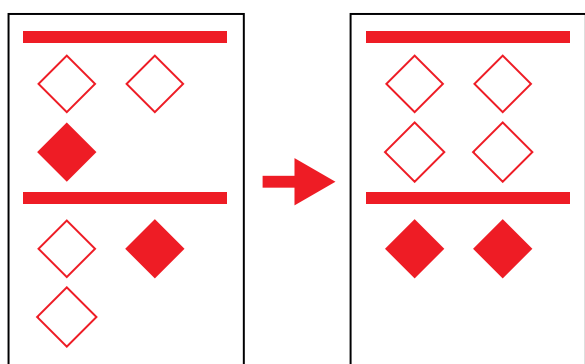

Why do we need it?

The GHS will reduce time and costs, remove barriers to trade, and protect people and the environment from chemical hazards

Who does it affect?

If you are a manufacturer, importer, seller or user of hazardous chemicals, you need to take action on changes to labelling and classification

What are the changes?

The changes affect the way chemicals are classified and how information is communicated

Pictograms

The GHS uses nine standard symbols with one of two word signal statements - danger or warning

Labels

Changes to labels include simpler hazard and precautionary statements

Safety Data Sheet (SDS)

The SDS uses clear language under 16 universal headings

Transition period

NSW must be GHS compliant by 31 December 2016

Other countries

Some of our largest trading partners have adopted the GHS, making trade easier between us

In Australia

Australia began transitioning in 2012 after adopting the GHS Third Edition

What do I need to do?

Make sure all your chemicals are classified under GHS, re-labelled and you have a new or updated SDS

Who do I contact?
